

Northern Ireland Composite Economic Index

Quarter 3 2016

Date: 19 January 2017
Geographical Area: Northern Ireland
Theme: Economy Statistics
Frequency: Quarterly

Key points

- This is the first quarter of results following the EU referendum on 23rd June 2016. The post-referendum picture is still emerging and will continue to do so over the coming quarters and years. It is not possible to separate out the specific impact of the referendum in this quarter.
- The Northern Ireland Composite Economic Index (NICEI) results show that NI economic activity was estimated to have grown by 1.6% from Quarter 3 (July – September) 2015 to Quarter 3 (July – September) 2016. However the index decreased by 0.9% in real terms between Quarter 2 (April – June) 2016 and Quarter 3 2016.
- Over the last two years annual output, (averaged over the four quarters to Quarter 3 2016 compared to the previous four quarters) increased by 1.5%.
- Although the measures are not produced on a fully equivalent basis, comparisons with the UK over the same period show that the NICEI grew at a slower rate (1.5%) compared to UK GDP growth (1.9%)¹. In the UK quarterly growth (0.6%) was also higher than that recorded for NI (-0.9%).
- The NI private sector index was estimated to have decreased by 0.9% over the quarter, but increased by 2.3% over the year to Quarter 3 2016, and by 2.3% over the last four quarters compared to the previous four.
- The Public sector jobs index decreased by 0.9% over the quarter, and is now at its lowest level since the series began in 2002. As previously reported, the index has been impacted by the Voluntary Exit Scheme (VES) implemented by the Northern Ireland Civil Service during 2015/16.

Figure 1: NI Composite Economic Index Quarter 3 2016

[Download in excel](#)

¹ NISRA have calculated this figure based on published GDP data by calculating the growth between the average GDP level of the four quarters up to quarter 3 2015 and the average of the four quarters up to quarter 3 2016.
NI Composite Economic Index Statistical Bulletin published 19th January 2017

This Report contains the following chapters:

Note that the data in this release can be downloaded in excel by clicking the button under the respective tables/charts. In addition, the summary tables and comparisons with the UK, ROI and Scottish GDP can be downloaded in Open Data Format from the [NINIS website](#).

Please note that this release is the first time the NICEI covers the post-EU referendum period. The post-referendum picture is still emerging and will continue to do so over the coming quarters and years. It is not possible to separate out the specific impact of the referendum in this quarter.

The next publication for Quarter 4 2016 results will be in April 2017.

The results for the NICEI for Quarter 3 2016 show that economic output in Northern Ireland (NI) decreased by 0.9% over the quarter but increased by 1.6% over the year to Quarter 3 2016. This is the eighth consecutive quarter of annual growth since Quarter 4 2015.

The performance reported by other economic indicators such as the labour and housing markets has been mixed. There is continued positive performance in indicators such as the housing market and falling claimant count, but this is offset by an increase in the unemployment rate and limited growth in employee jobs and number of new dwellings commenced.

The most recent NI [Labour Market Report](#) (January 2017) shows that over the quarter from September to November 2016 there was an increase in the unemployment rate (5.6%) of 0.1 percentage points (pps) from the previous quarter but a fall of 0.3 pps over the year. There was also a decrease (0.9 pps) in the employment rate (69.3%) and an increase (0.8 pps) in the economic inactivity rate (to 26.5%) over the most recent quarter.

The most recent [Quarterly Employment Survey](#) (published December 2016) shows that the number of jobs in September 2016 was essentially unchanged (-100 jobs) from the June 2016 estimate and growth over the year from the September 2015 estimate was limited to 0.1% (500 jobs).

The housing market continues to show signs of growth with the most recent [NI House Price Index](#) reporting that in Quarter 3 2016 property prices in NI recorded growth over the year (5.4%) and over the most recent quarter (0.8%). This is set against a backdrop of increased lending² and continued falling numbers of repossessions³. However the number of new dwellings started in Quarter 3 2016 remained relatively flat compared to the previous quarter and the year (compared to Quarter 3 2015).

As reported in previous bulletins, the NICEI is designated as an experimental index to reflect its status as a measure under development. Users should take this into account when interpreting results. Ongoing areas of development are highlighted below:

- The Public Sector jobs index of the NICEI is based on public sector jobs. This may be unduly impacted by the fact that the NI Civil Service underwent a period of strategic reorganisation in the form of a Voluntary Exit Scheme (VES) which sought to reduce the number of such jobs. For example, a ten percent reduction in public sector jobs may not equate to an equivalent fall in public sector output. NISRA is continuing to investigate how to improve the measure of public sector output as part of planned improvements to the NICEI series. This includes the assessment of various output measures for different public sector functions and analysis of public sector expenditure data and appropriate deflators.
- The Index of Construction component of the NICEI covers the output of construction firms' activity in Northern Ireland only. There is evidence to suggest that since the downturn many NI construction firms have been sending employees to work in projects based outside NI. NISRA is currently investigating the feasibility of including the value of such work in the construction index.

NI Composite Economic Index Quarter 3 (July to September) 2016

The NICEI is an experimental quarterly measure of the performance of the NI economy based on available official statistics. Existing published quarterly indices (i.e. Index of Services (IOS), Index of Production (IOP), Index of Construction (IOC), and public sector employee jobs data from the Quarterly Employment Survey (QES), plus unpublished agricultural output data from DARD) are weighted using ONS Regional Accounts Gross Value Added (GVA) data to provide a proxy measure of total economic output in the NI economy on a quarterly basis.

Key results (by private and public sector indices)

NI economic activity is estimated to have

- increased by 1.6% over the year; and
- decreased by 0.9% in real terms from Quarter 2 to Quarter 3 2016.

Private sector output

- recorded growth of 2.3% compared to the same quarter one year ago; and
- decreased by 0.9% in real terms over the quarter.

The Public sector jobs index

- decreased by 2.5% compared to Quarter 3 2015; and
- fell by 0.7% over the quarter.

On a slightly longer timeframe, the NICEI results show that annual output averaged over the four quarters to Quarter 3 2016 compared to the previous four quarters increased by 1.5% in real terms.

- The Private sector index increased by 2.3% over the same period;
- Whilst the Public sector jobs index decreased by 2.4%.

Table 1 provides a summary of changes over the quarter, year and rolling four quarters for the NICEI and its private and public sector jobs sub-indices.

Table 1: Overview of performance of Northern Ireland Economy, Quarter 3 2016

	Change on quarter	Change on year	Rolling annual average change ⁴
NICEI	-0.9%	1.6%	1.5%
NI Private Sector	-0.9%	2.3%	2.3%
NI Public Sector jobs	-0.7%	-2.5%	-2.4%

⁴ Most recent 4 quarters compared to previous 4 quarters

3

Contribution to change

Change over the year

The NICEI results show that over the year (Quarter 3 2015 to Quarter 3 2016):

- NI economic activity increased by 1.6%;
- the Private sector index experienced growth of 2.3%; and
- the index for the Public sector jobs decreased by 2.5%.

The increase in the NICEI over the year (1.6%) was driven by increases in:

- the Services sector (a contribution of 1.4 pps); and
- the Construction sector (a contribution of 0.6 pps)

These increases were partially offset by decreases in the Public sector jobs index (a contribution of -0.6 pps) and the Production sector (a contribution of -0.3 pps).

Figure 3: Contributions of component indices to annual change in the NICEI Q3 2016⁵

Change over the quarter

Latest results show that over the quarter to Quarter 3 (July - September) 2016:

- NI economic activity decreased by 0.9%;
- the Private sector index decreased by 0.9%; and
- the index for the Public sector jobs decreased by 0.7%.

The change (-0.9%) in the NICEI over the latest quarter was driven by decreases in the:

- Production sector (a contribution of -0.3 percentage points (pps));
- Services sector (a contribution of -0.3 pps);
- Public sector (a contribution of -0.2 pps); and
- Construction sector (a contribution of -0.1 pps).

The changes in each of these individual series can be found in Table 2 at the end of this document.

⁵ Please note figures may not sum due to rounding

Figure 2: Contributions of component indices to quarterly change in the NICEI Q3 2016⁶

Rolling annual average change

Looking at annual output (averaged over the four quarters to Quarter 3 2016) compared to the average of the previous four quarters the results show:

- NI economic output increased in real terms by 1.5%;
- The Private sector index experienced growth of 2.3%; and
- The Public sector jobs index decreased by 2.4%.

The growth in the NICEI (1.5%) over this period was a combination of increases in:

- the Services sector (contribution of 1.4 pps); and
- the Construction sector (contribution of 0.3 pps).

[Download in excel](#)

These increases were partially offset by a decrease in the Public sector jobs index (contribution of -0.6 pps) whilst the production sector had a marginal impact.

Figure 4: Contributions of component indices to rolling annual average change in the NICEI, Q3 2016

[Download in excel](#)

⁶ Please note figures may not sum due to rounding

4

Comparison with measures of GDP

The NICEI is not equivalent to the Office for National Statistics (ONS) quarterly measure of change in Gross Domestic Product (GDP) for the whole UK economy. This is because the ONS measure is based on a broader range of sources including output, income and expenditure estimates of economic activity, whereas the NICEI is based on output and employee jobs data. However, when applied to the equivalent UK data sources, the NICEI methodology has been shown to provide a close short term approximation to the UK GDP series (see [NICEI Methodology Paper](#)).

Although the measures are not produced on a fully equivalent basis, comparisons with the UK show that NI output decreased by 0.9% over the quarter, whilst the UK GDP⁷ increased by 0.6% from Quarter 2 2016 to Quarter 3 2016. The UK economy grew by 2.2% over the year to Quarter 3 2016 whereas NI output increased by 1.6%.

When the extent of change is considered over the last two years, it can be seen that average GDP growth for the four quarters to Quarter 3 2016 for the UK was 1.9% compared to the previous four quarters. The NI growth rate was 1.5% over the same period.

The UK has reported GDP growth in each of the last 15 quarters, whereas the NICEI has reported growth in 11 of the last 15 quarters. The NICEI is currently 7.0% below the maximum value recorded in Quarter 2 2007. In Quarter 3 2016, UK GDP was estimated to have been 8.1% higher than its pre-economic downturn peak of Quarter 1 2008. This suggests that the UK has had a shorter downturn with a faster recovery.

The most recent results show that Scottish GDP⁸ grew by 0.2% over the most recent quarter for Scotland) and increased by 0.7% over the year compared to Quarter 3 2015. The average growth for the four quarters to Quarter 1 2016 compared to the previous four quarters was 0.7%.

Looking at the Republic of Ireland Quarterly National Accounts⁹, the Irish economy has been growing at a faster pace than the UK over recent years (despite a decline in Quarter 1 2016), and reported growth in GDP of 4.0% over the quarter to Quarter 3 2016. Over the year to Quarter 3 2016 GDP increased by 6.6%, with an average annual growth of 9.7% (latest four quarters compared to the previous four quarters).

Please note that a table showing a comparison of the NI Composite Economic Index and GDP for the UK, Scotland and Republic of Ireland can be found in the downloadable tables on the [ELMSB](#) and [NINIS](#) websites.

⁷ [ONS Quarterly National Accounts](#), Quarter 3 (July to September) 2016 (The measure of GDP referred to is the chained volume index of GDP at market prices)

⁸ [Scottish Government Quarterly National Accounts, Quarter 1 2016](#) (Note that Quarter 2 GDP figures for Scotland are due to be published on the 9th November)

⁹ [CSO Quarterly National Accounts, Quarter 2 2016](#) (The measure of GDP referred to is the chained volume index at constant market prices, seasonally adjusted)

When the trend in the index is considered over the last three years there is some evidence that the rate of growth has remained steady. Annualised average growth over the last four quarters to Quarter 3 2016 compared to the previous four quarters was 1.5%. This was broadly similar annual growth over the previous 2 year period (to Quarter 3 2015), which was 1.6%.

The most recent [Labour Force Survey \(LFS\)](#) for September - November 2016 shows that despite the fall in LFS employment and increases in the unemployment and inactivity rates over the quarter, the latest figures indicate that employment remains higher and unemployment and inactivity lower compared to the same period last year (September – November 2015).

Annual LFS figures also continue to reflect a gradual decline in the unemployment rate over recent years from 7.6% in 2013, 6.6% in 2014, 6.1% in 2015 and 5.8% in 2016 based on figures until September – November.

The [Quarterly Employment Survey](#) published last month showed that the number of jobs has remained flat over the third quarter of 2016 and showed that annual jobs growth had slowed. There was an increase of 500 jobs over the year to September 2016 compared to annual jobs growth of 9,440 to September 2015.

NI Private sector growth in the four quarters to Quarter 3 2016 averaged 2.3% compared to the previous four quarters, and exceeded growth for the NI economy as a whole.

Annual growth between Quarter 3 2015 and Quarter 3 2016 has been reported in the Construction and Services sectors, whilst the Public and Production sectors recorded a decrease over the year. The Services sector made the largest contribution to the overall growth of the NICEI over the year to September 2016.

Although the sources are not fully comparable, there is continuing evidence that the annual average rate of growth in the NI economy lags behind that of the UK. Comparisons with the UK show that UK GDP grew by 2.2% over the year to Quarter 3 2016, whereas NI output increased by 1.6%. Considering the extent of change over the last two years, average GDP growth for the four quarters to Quarter 3 2016 for the UK was 1.9% compared to the previous four quarters. The NI growth rate was 1.5% over the same period.

An overview of the NICEI time series alongside an economic timeline of key world, European, UK and NI events to help place the performance of the NICEI into context is provided overleaf.

Figure 5: Overview of the performance of the NICEI alongside a timeline of key economic events, 2006-16

Further information on the state of the Northern Ireland economy, setting it in context with the UK and Republic of Ireland can be found in the latest Department for the Economy (DfE) [Economic Commentary](#).

Coverage

Together the existing IOS, IOP and IOC indices cover their respective elements of the private sector economy. Output data currently provided by DARD is unpublished and as such we are not able to disclose this data. No appropriate output data for the Public sector is collected in Northern Ireland and as a best available proxy public sector employment from the Quarterly Employment Survey (QES) was used, as recommended by ONS.

Further information on the main input data is presented below:

IOP: The quarterly NI Index of Production is currently based on a sample of around 1,000 businesses, which covers approximately 93% of the turnover of the population at the time of selection and a response rate of almost 90%. This includes a **census of all companies employing 40 or more employees as well as those employing 0 to 39 employees and having a turnover of £10 million or more**. The new sample has been designed to have a minimum precision of 10% for each of the production subsectors.

IOS: The quarterly NI Index of Services is currently based on a sample of around 3,300 businesses out of a population of c. 37,000. The sample consists of a census of dominant companies and a Neyman stratified random sample of the remaining companies and covers approximately 72% of turnover. The **census element consists of all companies employing 100 or more employees as well as those employing 0 to 99 employees and having a turnover of £10 million or more**.

IOC: From a sampling universe of approximately 10,000 firms, a disproportionate sample of 700 construction firms is randomly selected to take part in the NI Quarterly Construction Enquiry. The sample is disproportionately stratified (into six strata) using IDBR turnover as the stratification variable. This includes a **census of all companies with a turnover of £5.25m or greater**. Further information on the IOC sample coverage and methodology can be found [here](#).

Weighting and Combining the Data

The output series were produced as weighted aggregates of the above input series, where the weights were based on Gross Value Added (GVA)¹⁰ by industry obtained for Northern Ireland from Regional Accounts produced by ONS.

Please note that the latest available GVA by industry published in December 2016 refers to the year 2015.

Annual Chain-Linking

Annual chain-linking was used to combine the private Services, Production, Construction and Agriculture sectors to produce an index for the Private sector, which was then combined with the index for the Public sector to give an overall index for the economy. Use of annual chain-linking is standard National Accounts practice.

Seasonal Adjustment of the Indices

The indirect method of seasonal adjustment was employed. Seasonally adjusted figures were input (where possible) and when the combined output series were tested for seasonality there was no residual seasonality found, therefore no seasonal adjustment was required.

¹⁰ Please note that a glossary of national accounts terms and definitions can be found [here](#).
NI Composite Economic Index Statistical Bulletin published 19th January 2017

Base and reference year

As part of the Blue Book process (UK National Accounts), and in line with Eurostat guidance, the base year and reference year for chained volume estimates are moved forward by one year so that the estimates better reflect the industrial structures and prices currently seen within the economy. Re-referencing on its own does not cause revisions to real growth rates, but the rebasing process, taking on as it does new Gross Value Added and product weights from the supply and use balancing process, will cause revisions to the growth rates of chained volume components.

Public Sector Employees

The public sector employee jobs figures used in our analysis are sourced from the Office for National Statistics who compile the figures to produce their [Public Sector Employment publications](#). The public sector comprises central government, local government and public corporations as defined for the UK National Accounts.
